# Receiving Critical Results

Haiku push notifications are the most effective way to receive and acknowledge critical results.

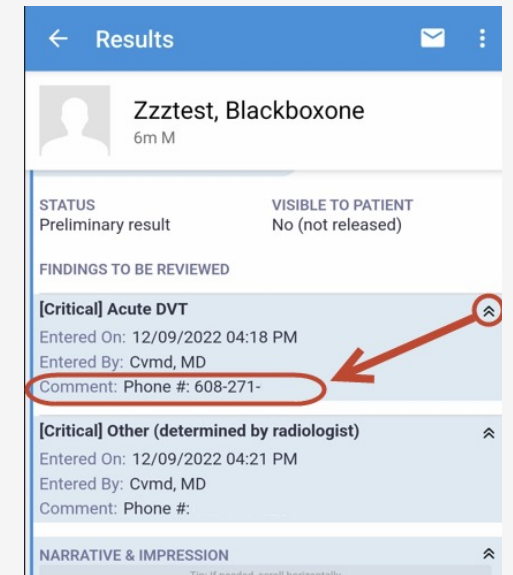

1 Critical Result notifications can appear directly on the Lock Screen.

2 They can also be viewed and acknowledged on the Notifications screen.

3 The results can be viewed and acknowledged in the Haiku In Basket.

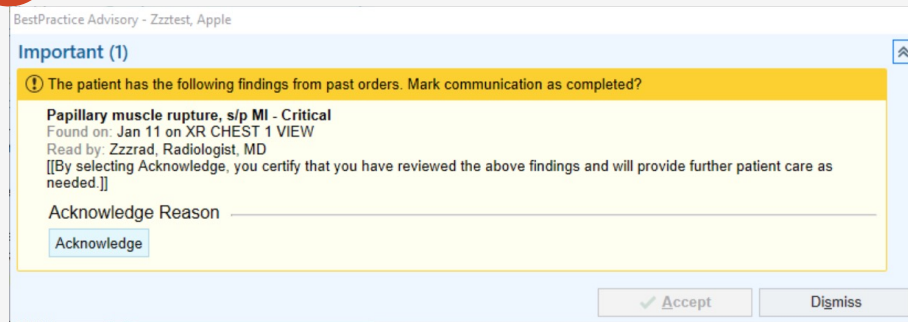

4 Radiologist callback number is visible by expanding the Critical message.

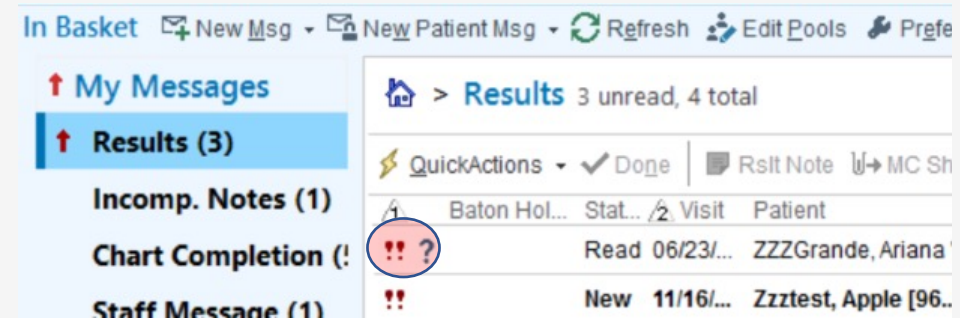

# Receiving Critical Results

Critical Results also appear throughout the patient's electronic chart in EPIC.

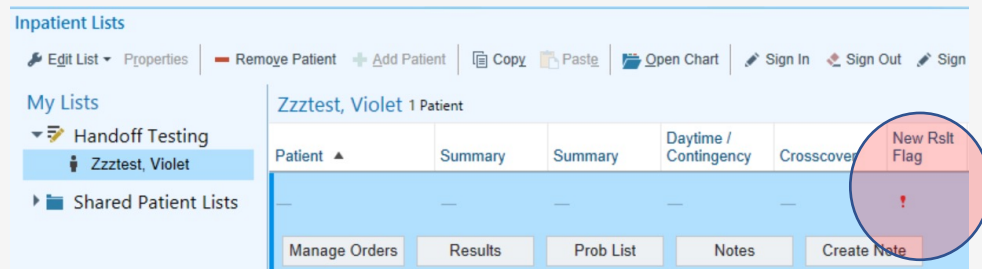

1 As an EPIC BestPractice Advisory

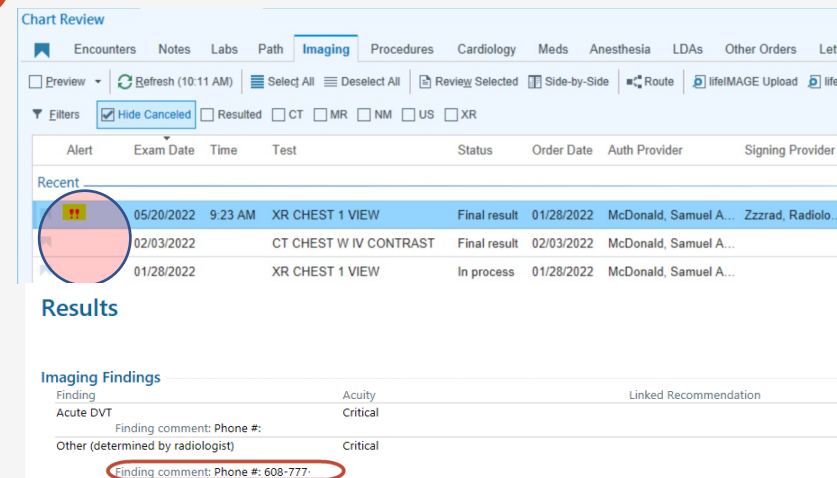

2 In the EPIC In Basket, marked with !!

3 Flagged in the Critical Results Column on the Patient List

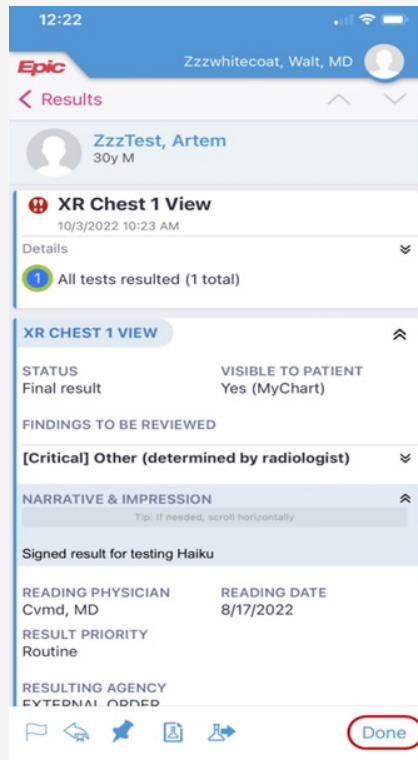

4 Flagged in Chart Review and Radiologist callback number in 'Finding comments'

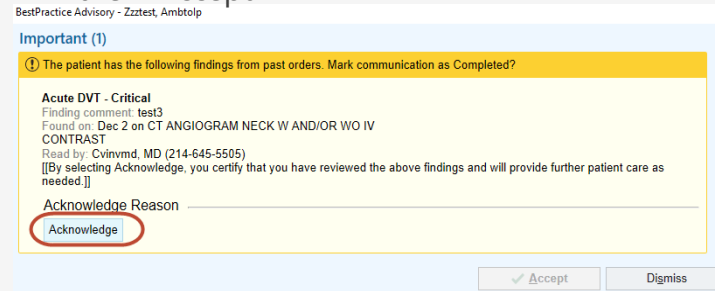

# Acknowledging Critical Results

Acknowledging Critical Results in Haiku closes the loop between the **notifying provider** and the **clinician**, preventing the need for further escalation.

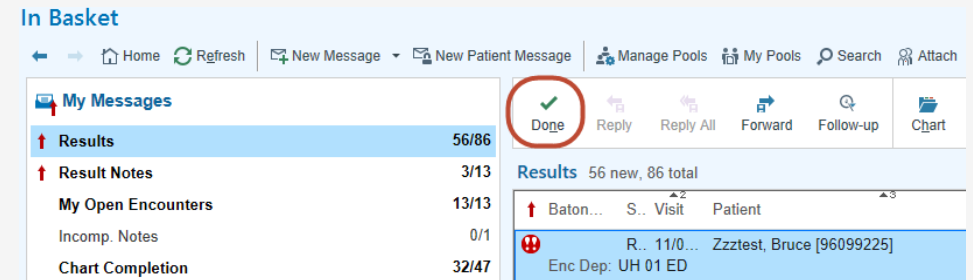

- 1 Haiku, select the notification and mark 'Done'

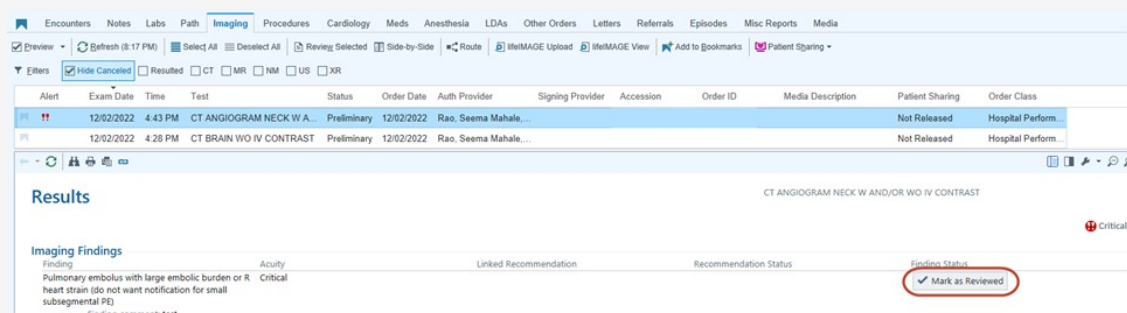

- 2 Best Practice Advisory, select 'Acknowledge' then 'Accept'

- 3 In Basket, mark as 'Done'

- 4 Chart Review, select 'Mark as Reviewed'

# Additional Information

2. [Setting up Haiku to Receive Critical Results: Android](#)
3. [Accepted List of Critical Results](#)
4. [Escalation Tables](#)

# Setting up Haiku to Receive Critical Results: IOS

1 Select **More** from the bottom of the screen in Haiku.

2 Click on **Notifications**.

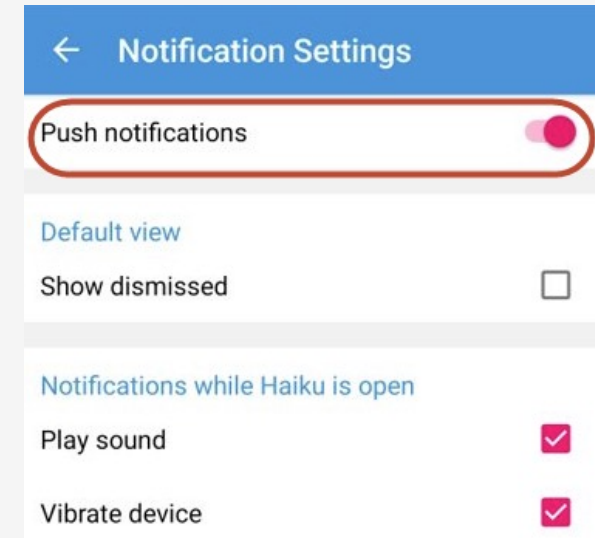

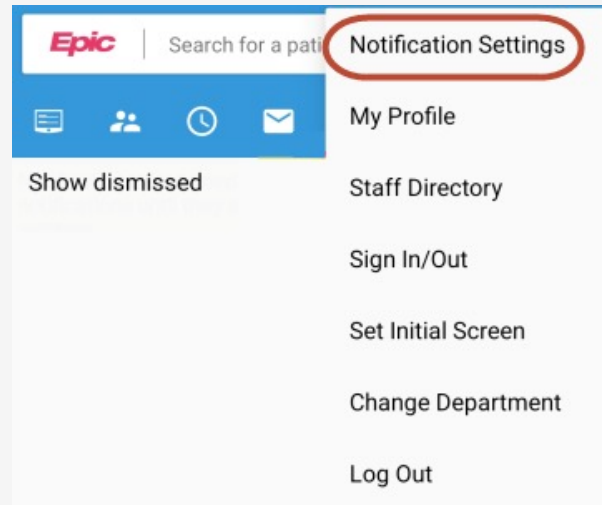

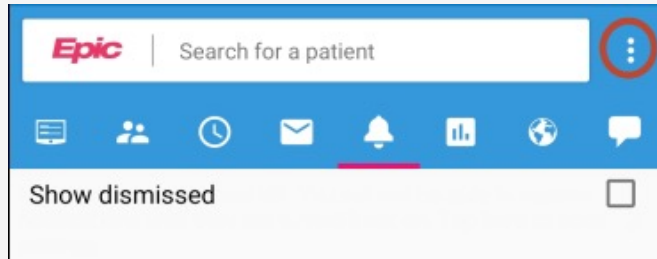

3 Click on **Settings** icon.

4 Use the slider to enable **Push Notifications**.

# Setting up Haiku to Receive Critical Results: Android

1 In the **Notification** activity, click on the **three dots** in the top-right.

2 Click on **Change Notification Settings**.

3 Use the slider to enable **Push Notifications**.

# Accepted List of Critical Results

---

## 1. Acute intracranial hemorrhage

## 2. Acute stroke

CAVEAT- stroke team already involved in most of these, so only when a new/unsuspected stroke not on a code stroke patient

## 3. Brain herniation

## 4. Spinal cord compression

## 5. New/unexplained pneumoperitoneum w high likelihood of bowel perforation

Not postop, post-g tube, PD Cath exchange, etc.

## 6. Intestinal ischemia

Portal/mesenteric venous gas, pneumatosis, etc.

## 7. Active hemorrhage

Active extravasation and large hemoperitoneum where patient could be unstable

## 8. Testicular torsion

## 9. Ovarian torsion

## 10. Ectopic pregnancy (high likelihood)

## 11. N/enlarging/tension PTX

Any Pneumothorax on a patient that is currently intubated without an ipsilateral chest tube

## 12. Acute Pulmonary embolus with large embolic burden or R heart strain

Not for small subsegmental or segmental PE

## 13. Ruptured aortic aneurysm

## 14. Acute vascular occlusion

## 15. New aortic dissection

## 16. Acute DVT

## 17. Malpositioned line/tube

Significant malpositioning – e.g. dobhoff in lung, venous line in artery

## 18. Fetal bradycardia <100 beyond 24 weeks

## 19. Other (determined by radiologist)
